CALIBER ANALYTICAL SERVICES USING CLEANSTEPSSM WINDPOWER TO POWER THEIR LABORATORY

CAS joins the growing sustainable business community, choosing emission-free wind energy as the next step in environmental stewardship

Towson, MD – Caliber Analytical Services (CAS) is pleased to announce that they have committed to purchasing **100%** wind energy credits to power their business, reducing the carbon footprint of the company and helping to cultivate a healthier community. This means that their customers can rest easy knowing that by supporting CAS, they are also supporting clean energy.

Wind energy is making a big difference in America. The wind energy that CAS uses fosters the development of new wind energy and protects air quality.

CAS firmly believes that the small business community must do their part to foster a better, cleaner, more sustainable energy future. They are committed to supporting a progressive energy policy for the State of Maryland.

In 2007, thousands of homes and hundreds of businesses purchased CleanStepsSM Windpower from Washington Gas Energy Services helped to prevent the harmful effects of traditional energy supplies.

The effects of their commitment are immense, and are a part of CAS's mission to foster a cleaner environment. By using wind energy, we are helping the environment, and also keeping the air clean, preventing the need for new, polluting fossil fuel power plants to meet growing energy needs.
